Burns are one of the most devastating conditions encountered in medicine. The injuries affect people of all ages, both physically and psychologically, in the developed and the developing world. The correct management of burns needs a skilled multidisciplinary approach and this ABC provides an overview of the most important aspects of burn injuries for healthcare professionals. This ABC book offers a comprehensive yet accessible review of burn management. It introduces the range of burns that a GP may become involved in treating or having treated at hospital. From explanations of how burns happen, through to first aid applications, pre-hospital treatment, dressings, resuscitation and the management of deep dermal burns. It also looks at the subsequent management of burns through hyperalimentation and microbiological management, reconstruction and rehabilitation. A significant contribution to an important area of care: burns are the second most common cause of accidental death in children in the UK. Early treatment of burns is essential to avoid disablement: impact on lungs, infection and later need for plastic surgery can all be reduced by appropriate assessment and prompt treatment. Includes contributions from the UK, USA and Australia, and has a chapter on international disasters. Presented in a clear and concise manner with many illustrations, this book will appeal to a wide readership including medical students, nurses, hospital doctors, and general practitioners.

The diagnosis, prognosis and choice of various types of treatment of burn wounds depends largely on the physical appearance of the wound itself and of the surrounding tissue. This atlas offers a selection of illustrations of common and unusual burns, caused by a variety of agents. The accompanying captions provide an introduction to the identification and classification of burns. Outlines of the appropriate management are offered for each type of injury, with before, during and after treatment sequences where necessary.

Total Burn Care guides you in providing optimal burn care and maximizing recovery, from resuscitation through reconstruction to rehabilitation! Using an integrated, "team" approach, leading authority David N. Herndon, MD, FACS helps you meet the clinical, physical, psychological, and social needs of every patient. With Total Burn Care, you'll offer effective burn management every step of the way! Effectively manage burn patients from their initial presentation through long-term rehabilitation. Devise successful integrated treatment programs for different groups of patients, such as elderly and pediatric patients. Browse the complete contents of Total Burn Care online and download images, tables, figures, PowerPoint presentations, procedural videos, and more at www.expertconsult.com! Decrease mortality from massive burns by applying the latest advances in resuscitation, infection control, early coverage of the burn, and management of smoke inhalation and injury. Enhance burn patients' reintegration into society through expanded sections on reconstructive surgery (with an emphasis on early reconstruction), rehabilitation, occupational and physical therapy, respiratory therapy, and ventilator management.

"Child injuries have been neglected for many years, and are largely absent from child survival initiatives presently on the global agenda. Through this World report on child injury prevention, the World Health Organization, the United Nations Children's Fund and many partners have set out to elevate child injury to a priority for the global public health and development communities. The knowledge and experience of nearly two hundred experts from all continents and various sectors were invaluable in grounding the report in the realities faced in many countries. This World report on child injury prevention should be seen as a complement to the UN Secretary-General's study on violence against children released in late 2006. That report addressed violence-related or intentional injuries. Both reports suggest that child injury and violence prevention programmes need to be integrated into child survival and other broad strategies focused on improving the lives of children. Evidence demonstrates the dramatic successes in child injury prevention in countries which have made a concerted effort. These results make a case for increasing investments in human resources and institutional capacities. This would permit the development, implementation and evaluation of programmes to stem the tide of child injury and enhance the health and well-being of children and their families the world over. Implementing proven interventions could save more than a thousand children's lives a day." - p. vii.

The aim of this book is to give readers a broad review of burn injuries, which may affect people from birth to death and can lead to high morbidity and mortality. The book consists of four sections and seven chapters. The first section consists of the introductory review chapter, which overviews the burn injuries. The second section includes chapter "Burn Etiology and Pathogenesis," which focuses on burn injuries and clinical findings. The third section consists of chapter "Controlling Inflammation in Burn Injury" and is devoted to the role of inflammatory response, which is fundamental to the healing process, while a prolonged inflammation may lead to scarring and fibrosis. The fourth section consists of four chapters as follows: "Therapeutic Effects of Conservative Treatments on Burn Scars," "Herbal Therapy for Burns and Burn Scars," "Platelet-Rich Plasma in Burn Treatment," and "Surgical Treatment of Burn Scars." The book is easy to read and includes hot topics on burn injury to enhance the reader's understanding and knowledge.

This book covers essential information necessary in diagnosing and treating pediatric patients in the emergency room. Emergencies require quick and precise decision making that does not allow for extended reading or fact-checking to ensure all factors are considered. This pocket guide addresses that need by placing vital clinical management and algorithms into a quick and simple guidebook that can be accessed within moments from a scrub pocket or white coat. It is an easy, quick access reference that can be used for those facts that are absolutely essential, but are often difficult to remember. Color images and flow charts allow doctors to grasp the essentials quickly, while more detailed explanations are included alongside for trainees. Quick Hits for Pediatric Emergency Medicine uses tips, caveats, drug dosing, and pearls to assist the provider who may not be familiar with all of the unique nuances of the pediatric population. This is ideal for emergency department physicians, nurses, and trainees including students, residents, and fellows.

approach to the provision of wound care, ABC of Wound Healing: Covers common wounds including traumatic wounds, surgical wounds, diabetic foot ulcers, pressure injuries, and venous and arterial leg ulcers Emphasises the importance of reaching a diagnosis, the fundamental step in managing any wound Provides up-to-date information on physical, chemical, biological and emerging therapies for patients with various types of wounds Contains hundreds of full-colour illustrations and clinical photographs of wounds and treatments ABC of Wound Healing, Second Edition, remains a must-have guide for junior doctors, specialist registrars in medicine and surgery, specialist nurses, general practitioners and medical students.

The burns patient, during the course of the resulting injury, undergoes a variety of physical and psychological changes. The multidisciplinary team needs an understanding of the pathophysiological effects of burns and the management required at each stage of recovery. This book discusses the pathophysiology and the classification of burns and emphasizes the importance of correct action in the first 48 hours. It looks at the special care required by the patient with an inhalation injury and examines the management of pain for burns patients. There is also a thorough analysis of wound care and early wound excision and grafting.

An authoritative guide to theory and applications of heat transfer in humans Theory and Applications of Heat Transfer in Humans 2V Set offers a reference to the field of heating and cooling of tissue, and associated damage. The author—a noted expert in the field—presents, in this book, the fundamental physics and physiology related to the field, along with some of the recent applications, all in one place, in such a way as to enable and enrich both beginner and advanced readers. The book provides a basic framework that can be used to obtain 'decent' estimates of tissue temperatures for various applications involving tissue heating and/or cooling, and also presents ways to further develop more complex methods, if needed, to obtain more accurate results. The book is arranged in three sections: The first section, named 'Physics', presents fundamental mathematical frameworks that can be used as is or combined together forming more complex tools to determine tissue temperatures; the second section, named 'Physiology', presents ideas and data that provide the basis for the physiological assumptions needed to develop successful mathematical tools; and finally, the third section, named 'Applications', presents examples of how the marriage of the first two sections are used to solve problems of today and tomorrow. This important text is the vital resource that: Offers a reference book in the field of heating and cooling of tissue, and associated damage. Provides a comprehensive theoretical and experimental basis with biomedical applications Shows how to develop and implement both, simple and complex mathematical models to predict tissue temperatures Includes simple examples and results so readers can use those results directly or adapt them for their applications Designed for students, engineers, and other professionals, a comprehensive text to the field of heating and cooling of tissue that includes proven theories with applications. The author reveals how to develop simple and complex mathematical models, to predict tissue heating and/or cooling, and associated damage.
