Design Considerations. The general purpose of earthing system is to protect life and property in the event of 50/60 Hz faults (short-circuit) and transient phenomena (lightning, switching operations). The question of how a system shall be earthed is governed by the regulation. The choice of earthing to one point on each system is designed to prevent the passage of current through the earth under normal conditions, and thus to avoid the accompanying risks of electrolysis and interference with ...

Electrical Design. What is a resistance grounding? Resistance grounding in an electrical system is defined as the use of a resistor as a grounding path between the neutral point of transformer or generator and the earth ground. There are two methods to accomplish this system of grounding, namely the low resistance grounding and high resistance grounding.
