This volume brings together a number of important perspectives on language documentation and endangerment in Africa from an international cohort of scholars with vast experience in the field. Offering insights from rural and urban settings throughout the continent, these essays consider topics that range from the development of a writing system to ideologies of language endangerment, from working with displaced communities to the role of colonial languages in reshaping African repertoires, and from the insights of archeology to the challenges of language documentation as a doctoral project. The authors are concerned with both theoretical and practical aspects of language documentation as they address the ways in which the African context both differs from and resembles contexts of endangerment elsewhere in the world. This volume will be useful to fieldworkers and documentalists who work in Africa and beyond.

This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.
