This fascinating book provides a detailed history of one of the most famous, and controversial, firearms manufacturers, and its products. Smith & Wesson, founded in 1852 by two men, Horace Smith and Daniel B. Wesson who shared a dream of developing a new type of firearm. Their ideas moved firearms manufacturing out of the muzzle-loading era that had dominated the industry since the invention of the hand cannon in the 14th century. Complete with more than 200 full-colour photographs, this stunning book describes the range of Smith & Wesson firearms in detail, and features cutaway drawings to show the mechanisms, along with detailed technical evaluations. As well as being of interest to enthusiasts and historians, it will be an excellent reference work and an invaluable guide for collectors.

Types and causes of tube failures, what to expect from tubes, testing methods, and all about tube maintenance programs. Over 80% of all electronic equipment defects result, directly or indirectly, from tube failures. Why do tubes fail? What can be done to prevent them from failing before their time? How can you determine whether a tube is good or bad, or how long it will work in a given circuit? Should tubes be replaced periodically, whether they've failed or not...or should they be tested every so often, and replaced if indications show them to be below par? This book supplies the answers to these and many many more questions!

An examination of the concept of collective security in international law and international relations from normative and institutional perspectives.

We revisit Lipset's law, which posits a positive and significant relationship between income and democracy. Using dynamic and heterogeneous panel data estimation techniques, we find a significant and negative relationship between income and democracy: higher/lower incomes per capita hinder/trigger democratization. Decomposing overall income per capita into its resource and non-resource components, we find that the coefficient on the latter is positive and significant while that on the former is significant but negative, indicating that the role of resource income is central to the result.

During more than 30 years, as a collaborator with American, European and Latin American electronics magazines (\*), has published a large assortment of practical circuits using common parts. In 1999 he included the first selection in a volume published by Prompt Publications in USA. The idea was to proceed with the series, publishing many volumes more. But, Prompt closed his activities and the idea was forgotten although the first volume became a best seller. Now with his own publishing house (NCB Publications) the author returned with the idea of making many volumes more of the series. So, the second volume is here proceeding with the same idea: give simple projects to the experimenters who want to learn electronics using common parts and with no need of special knowledge about electronics. So, as in the first volume, many of the projects collected by the author are included in this volume, most of which you can build in one evening. The projects range from fun types through practical types to amusement types. Of course, there are other devices that can be used to teach you something about circuits and components. An important feature of these projects are the ideas to explore, intended for students looking for projects in science or to use in practical research. This ideal can be complemented by our book Science Fair and Technology Education Projects, also published in English by the author. We can consider this book as a source book of the easiest and fun-to-make of hundreds of projects created and published by the author during his life. (see more about Newton C. Braga in "about the author" in his site).
